The Moscow Guided Missile Plant Khimki 456 consists of a secured, rail-served plant area and an associated static test area located approximately 0.5 nm to the north. The Test Area contains 3 vertical test stands, a possible test stand, 2 large and numerous small support buildings, and a large circular tank.

25X1D

A new tower approximately 250 feet high and still under construction was observed on KEYHOLE photography of [REDACTED] it is located in the Test Area at 55-55-10N 37-26-40E, immediately north of the circular tank and near the test stands. The tower was not present on KEYHOLE photography of [REDACTED] As seen on recent ground photography, the tower appears to be a circular segmented structure surrounded by scaffolding, with a tall construction crane nearby.
